Also included are a nucleic acid which encodes the thermostable luciferase, a vector comprising the nucleic acid, a cell transformed with the vector, a plant comprising the cell, producing the thermostable luciferase and a kit comprising the thermostable luciferase. The thermostable luciferase is useful in any bioluminescent assay which utilises luciferase/luciferin reaction as signaling mode. The present sequence is a mutagenic PCR primer used to construct a DNA encoding a mutant luciferase from Photinus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-SEP-2004

The present invention describes a method for detecting bone Paget's disease. The method comprises measuring the mutation or expression dose of chondroitin/chondroitin sulphate synthase gene. Also described are knockout animals obtained by partially or completely inhibiting expression of the chondroitin/chondroitin sulphate synthase genes encoding the amino acid sequences of SEQ ID No's 2, 4, 6, 66, 68, or 70, of 882, 775, 327, 884, 774 or 327 amino acids, respectively, or their homologues. The method can be used for detecting bone Paget's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, are xenotransplant rejection or mechanical organ replacement rejection, in a individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    detection; bone Paget's disease; Paget's disease; chondroitin/chondroitin sulphate synthase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human beta-4-galactosyltransferase 7 PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         07-NOV-2003; 2003WO-JP014211.

                    of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleac acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) the invention which was used to genotype human Rho family guanine-nucleotide exchange factor KIAA0861 gDNA which has been mapped to chromosomal position 3q27.3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pathological conditions for represents a PCR primer for (beta4GalT7), which is used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 1913
ADN75141/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC 3' end does not contain seven or more bases that are perfectly matching CC except one mismatch to the 3' end sequence of the first primer or the Second primer, the first primer at its 3' end does not contain six or CC more bases that are perfectly matching to a sequence anywhere of the CC first primer or the second primer, and the first primer at its 3' end CC does not contain eleven or more bases that are perfectly matching except CC one mismatch to a sequence anywhere of the first primer or the second CC primer. The method is useful for designing primers for simultaneous CC amplification of target DNA fragments in a single multiplex polymerase CC chain reaction. It is also useful in the identification of multiple genes CC related to multifactorial diseases, the genome-scale detection of genetic CC alterations, the studies in pharmacogenetic reactions, the genotyping CC genetic polymorphisms in a large population, the gene expression CC profiling in various samples and high throughput genotyping technologies. This sequence corresponds to an example of a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

CC The methods and compositions of the present invention are useful for CC isolating and characterising archaeal or Pfu DNA polymerases with reduced DNA polymerases that were likely to reduce uracil detection, while having composition is a mutagenic PCR primer used to create the mutants of the present contaction activities. Mutations were introduced into the composition is a mutagenic PCR primer used to create the mutants of the present convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The disease-predisposing haplotype further comprises a variant allele or an allele chosen from JWI5, JWI6, JWI7 and JWI8 variant allele or an allele chosen from JWI5, JWI6, JWI7 and JWI8 variant allele. The disease-predisposing haplotype further comprises an allele at a single nucleotide polymorphism (SNP) chosen from SNPB, SNP12, and SNP13. The method is useful for diagnosing or predicting susceptibility to a variety of autoimmune diseases such as Crohn's disease, psoriasis, ulcerative colitis, myasthenia gravis, autoimmune gastritis and Type I diabetes. The present sequence represents a primer used to sequence the nucleotide sequence of NOD2/CARD15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   comprises
haplotype
amplification of target DNA fragments in a single multiplex polymerase chain reaction by aligning a first primer and a second primer. The method comprises (a) aligning a first primer and a second primer; and (b) selecting the first primer where the first primer at its 3' end does not
                                                                                                                             Designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction, for high throughput multiplex DNA sequence amplification, comprises aligning two primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; primer; simultaneous amplification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC contain four or more bases that are perfectly matching to the 3' end CC sequence of the first primer or a second primer, the first primer at its CC 3' end does not contain seven or more bases that are perfectly matching CC except one mismatch to the 3' end sequence of the first primer or the CC more bases that are perfectly matching to a sequence anywhere of the first primer or the second primer, and the first primer at its 3' end CC one mismatch to a sequence anywhere of the CC one mismatch to a sequence anywhere of the first primer or the second CC one mismatch to a sequence anywhere of the first primer or the second CC one mismatch to a sequence anywhere of the first primer or the second CC amplification of target DNA fragments in a single multiplex polymerase CC chain reaction. It is also useful in the identification of multiple genes CC eleted to multifactorial diseases, the genome-scale detection of genetic CC alterations, the studies in pharmacogenetic reactions, the genotyping CC genetic polymorphisms in a large population, the gene expression CC profiling in various samples and high throughput genotyping technologies. This sequence corresponds to an example of a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The invention relates to a method of designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction by aligning a first primer and a second primer. The metho comprises: (a) aligning a first primer and a second primer; and (b) selecting the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end sequence of the first primer or a second primer, the first primer at its

The method

Designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction, for high throughput

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a new isolated polypeptide (I) comprises a fully CC defined sequence of, a mature form, one or more conservative substitutions or at least 95% identity to 158 amino acids SEQ ID NO: 2n CC as given in the specification, where n is an integer between 1-33. The CC and proteins of the invention are members of the following families: CC intracellular protein-like proteins; sorting nexin 6-like proteins; convel proteins; cMob5 cancer specific proteins; LRP16 protein-like proteins; CC like proteins; cMob5 cancer specific proteins; LRP16 protein-like proteins; cmounglobulin-like LRR-domain containing proteins in the proteins; containing proteins actin-binding proteins actin-binding proteins; actin-binding proteins; actin-binding proteins; are proteins; actin-binding proteins; haematopoietic contains; actin related protein 2/3 complex subunit IA-like proteins; contains; actin-like proteins; haematopoietic contains; and tumour protein proteins; leucine-rich protein-like proteins; contains; and tumour protein proteins; leucine-rich protein 130-like proteins; and traatment of the present invention are useful for the contains and treatment of disorders associated with aberrant expression con activity of the NOVX polypeptide, such as cancer, diabetes, obesity, con activity of the NOVX polypeptide, such as cancer, diabetes, obesity, con activity of the order and also be used in the protein and acceening assave, chromosome mapping, tissue typing the protein or activity of the contain assave, chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

A genomic library of 0.5-1.5 kb fragments from the rose variety of 0.5-1.5 kb fragments from the rose variety of constructed in pUC18 and used to transform Escherichia coli and the cells tested against a high-density array of synthetic microsatellites. Inserts in plasmids that hybridised were sequenced and the identified sequences selected for ability to differentiate between a set of 30 rose varieties. The oligonucleotides are used for genetic analysis of cultivated and wild types of roses, particularly for genetic mapping and labelling of mono- or poly-genic traits, selection, analysis of relatedness, identification of varieties and evaluation of varietal purity, identification of hybrids and plant breeding. The
The invention relates to a novel non human knock-in (transgenic) animal carrying DNA with at least one manganese superoxide dismutase (MnSOD) exon flanked by two recombinase recognition sequences. The invention is useful for creating mouse models for use in researching ageing, including specific diseases such as Parkinson's disease and arteriosclerosis. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         purity, identification of nybrids and plant plant preceding do not require oligonuclectides are useful in automated processes, do not require radioactive detection methods and can differentiate between almost radioactive detection methods are recommended and detection detec
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Non human knock-in (transgenic) animal comprising manganese superoxide dismutase exon, is useful in researching ageing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmume diseases, degenerative nervous system diseases graft versus host disease, hypersensitivity diseases, infectious directions directions directions directions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of EEFIA2 expression or activity; and a screening assay to identify new anticancer agents. The methods of the invention are useful for diagnosing, prognosing or treating cancer, especially overian cancer, breast cancer or colorectal cancer. Sequences ADH02696-ADH02697 represent human EEFIA2 phosphorothioate antisense oligonucleotides used to inhibit

Autoimmune diseases include Addison's disease, 'abrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Schistosomes, filaria and bacterial infections such as those caused by Schistosomes, filaria and bacterial infections such as those caused by Schistosomes, filaria and bacterial infections such as those caused by Schistosomes, Illymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta PCR primer.

This invention describes novel oligonucleotides derived from microsatellite markers and used for the amplification of the rose genome. The invention also describes a test kit for genetic analysis of cultured or wild forms of the genus Rosa sp. that contains at least one of the new oligonucleotide primers and preparing microsatellite markers of Rosa sp. by PCR amplification of hypervariable genomic regions, using at least one primer pair, to produce polymorphic fragments which are separated and detected. The primer pairs flank the microsatellite locus being amplified. The amplified markers are separated by electrophoresis, especially on high-resolution agarose or native or denatured polyacrylamide gels, or by mass spectrometry. After separation, the amplification stretched by staining (ethicium bromide or silver),

radioactive labelling and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a polynucleotide (I) relating to saccharide or lipid metabolism. (I) has antidiabetic, anorectic and hypolipaemic activities, and can be used in gene therapy. The polynucleotide (I) and its encoded polypeptide as well as its antibody are applicable in the diagnosis of and developing drugs for e.g. diabetes, obesity, hyperlipidaemia and hypercholesterolaemia, including by gene therapy. The polynucleotide (I) shows an elevated expression due to the administration of an insulin resistance-improving agent. The present sequence is used in the exemplification of the present invention.

The invention relates to a method of diagnosing cancer in an individual by measuring the genetic amplification, mRNA levels or protein levels of the elongation factor isoform EEFHA2 (also known as eEF-lalpha2) and comparing them with those from a normal control. An increase in EEFHA2 amplification or mRNA or protein levels relative to the control is indicative of the individual having cancer. The invention also relates to a method for prognosing survival and selecting an effective treatment regimen for a patient suffering from cancer; a kit for prognosing and/or diagnosing cancer; a method for inhibiting expression of EEFHA2 in a tumour cell using an EEFHA2 antisense oligonucleotide, especially a ribozyme; a method of treating cancer by administration of an inhibitor

Diagnosing cancer in a subject by comparing the measured EEFIA2 gene amplification, or EEFIA2 mRNA or protein levels or activity in a biological sample obtained from the subject with those in a control.

The primers of the invention may be useful for the detecting cytokeratin 18-20 expression an indicator for the diagnosis of tumour metastasis, particularly prostate cancer and lymphoma. The amplification using the primers is highly efficient and allows very sensitive detection of tumour

The invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a construction of the composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The correct the amount of target polypeptide present in the lungs. The confidence or condition such as pulmonary vasoconstriction, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, confilammation, allergies, asthma, impeded respiration, respiratory construction rejection, pulmonary infections, bronchies or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the outer of the auti-sense oligos corresponding to the outer of the surface of the corresponding to the outer of the surface of the corresponding to the outer of the surface of the corresponding to the outer of the surface of the corresponding to the outer of the surface of the corresponding to the outer of the surface of the corresponding to the outer of the surface of the corresponding to the outer of the surface of the corresponding to the outer of the surface of the outer of the outer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            surfactant depletion or hyposecretion, when administered to a mammal. oligonucleotides are derived from a gene encoding or regulating oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.
                                                                                                                       the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating ast oligonucleotide containing less percentage nucleic acids associated with lung airway cbronchodilating agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bronchoconstriction, respiratory tract inflammation, allergreducing adenosine sensitivity, levels of adenosine (A) or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   comprising oligonucleotides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2003-093058/08

                         invention are useful for the manufacture of a medicament for treatir syndrome associated with a human disease comprising a pathology associated with the protein, such as: cancer or immune associated disorders. The present DNA sequence was used as a PCR primer for a N protein coding sequence in an example of the immentation.
                                                                                                                                                                                                              Alsobrook JP, Bader JS, Berghs C, Burgess CE, Casman SJ; Catterton E, Chaudhuri A, Edinger SR, Ellerman K, Gerlach VL; Gorman L, Guo X, Herrmann JL, Ji W, Khramtsov NV, Li L, Mil Ort T, Patturajan M, Rastelli L, Rieger DK, Shenoy SG, Shimk Spytek KA, Vernet CAM, Zhong H, Zhong M;

junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of usquinone or lung suffactant in a subject's tissue, or treating bronchoconstriction,
Sequence
                                                                 lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel pharmaceutical composition, where the strike agent comprising an oligonucleotide antisense to initiation codon, coding region, 5' or 3' end genomic flanking 5' and 3' intron-exon junctions, or regions within 2-10 nucleot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure;

contracted acid, involving hybrid, conducting template contextendible nucleic acid to form a labelled hybrid, conducting template caterostible nucleic acid to form a labelled hybrid, conducting template caterostic context and the presence of a polymerase and non context nucleic acid, involving product indicating the identity of the nucleotide at the variant site. The invention also relates to a method context nucleic acid, involving hybridising a primer bearing a first fluorophore to a segment of the target nucleic acid to form a labelled context of the primer hybridises to the target nucleic acid, involving hybridising a primer bearing a first card to form a labelled context of the primer hybridises to the target nucleic acid, where the 3'-end of the primer hybridises to the target nucleic acid to form a labelled context of the primer in the presence of a polymerase and at a caterostic product to form a labelled context of the primer in the presence of a polymerase and at a complementary to the primer in the presence of a polymerase and at the first and second fluorophore, where a double-labelled extension product is formed if the non-extendible nucleotide is complementary to the nucleotide at the variant site and the first and second fluorophore borne by the extension product are brought and acceptor fluorophore borne by the extension product are brought to the target nucleic acid, where the first and second fluorophore comprise a donor and an acceptor fluorophore which have a donor-acceptor spacing a high extinction coefficient and a low fluorescence and at the extension product, the presence or absence of the double-labelled extension product, the presence or absence of the double-labelled extension product, the presence or absence of the double such as analysing point mutations and single nucleotide polymorphisms (SNPs). The methods are also useful for a variety of applications in which specific sequence information is of value, including detection of particular to particular to certain therapeutics. The m The invention relates to a method of analysing a variant site of a target nucleic acid, involving hybridising a primer bearing a fluorophore to the primer used in the method of the invention.

                                                    CC dependent extension of the primer in the presence of a polymerase and non concluded to form a labelled hybrid, conducting template-
CC dependent extension of the primer in the presence of a polymerase and non conclude-labelled extension product indicating the identity of the concluded at the variant site. The invention also relates to a method concluded the identity of a nucleotide at a variant site of a concluded the identity of a nucleotide at a variant site of a concluded the identity of the concluded inmediately adjacent to the target nucleic acid to form a labelled concluded immediately adjacent to the primer hybridises to the target nucleic acid dimmediately adjacent to the variant site, conducting template-
CC double-labelled extension of the primer in the presence of a polymerase and at concluded is complementary to the nucleotide at the variant site and the concluded is complementary to the nucleotide at the variant site and the concluded is complementary to the nucleotide at the variant site and the concluded in acceptor fluorophore while the primer is hybridised to the target nucleic acid, where the first and second fluorophore comprise a donor and an acceptor fluorophore which have a donor-acceptor spacing controlled between a high satisfact and a low fluorophore comprise a high satisfact and a low fluorophore comprise controlled by the extension product of less than 18 nucleotides, the donor acceptor spacing controlled by the extension and a low fluorophore comprise controlled by the extension and a low fluorophore comprise controlled by the extension and a low fluorophore comprise controlled by the extension product of less than 18 nucleotides, the donor acceptor spacing controlled by the extension and a low fluorophore comprise controlled by the extension and a low fluorophore comprise controlled by the extension product of less than 18 nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SS

The invention relates to a method of analysing a variant site of a t nucleic acid, involving hybridising a primer bearing a fluorophore t target nucleic acid to form a labelled hybrid, conducting template-dependent extension of the primer in the presence of a polymerase are extendible nucleotide and detecting the presence or absence of the double-labelled extension product indictae presence or absence for nucleotide at the variant site. The invention also relates to a methor determining the identity of a nucleotide at a variant site of a

and target non

Analyzing variant site of target nucleic acid, involves hybridizing primer to target nucleic acid, conducting template-dependent extens primer, detecting presence or absence of double-labeled extension

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (SNPB). The methods are also useful for other applications in which specific sequence information is of value, including detection of pathogens, paternity disputes, prenatal testing and forensic analysis, for developing correlations between certain genotypes and patient prognosis, for formulating optimal treatment protocols for a particular disease, for assessing the actual risk of an individual known to be susceptible of acquiring a disease and for identifying point mutations i microorganisms that could potentially result in altered pathogenicity or resistance to certain therapeutics. The methods are further useful for identifying carriers of mutant alleles, for tissue classification or in blood typing. This sequence represents a cyanine (CYA) dye-labelled primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                             11-APR-2000; 2000US-00547292

This invention relates to a novel isolated DNA sequence and the proteins encoded by them. The sequences disclosed may be useful during the development of compounds with a neuroprotective, ophthalmological, cytostatic, cardiant or antiarrhythmic activity. In addition the sequences may be useful for gene therapy. Specifically claimed is an isolated DNA comprising any of the 11 fully defined sequences of 1006-7062 bp given in the specification. The polynucleotide encodes a polypeptide comprising any of the 11 fully defined sequences of 89-1707 amino acids given in the specification. The DNA and protein are useful as molecular markers, as drug targets, and for detecting, diagnosing, staging, monitoring, prognosticating, preventing, treating or determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              some bacterial and protozoa infections. Recombinant heparanase can also be used to neutralise plasma heparin, as a potential replacement of protamine. Sequences of the invention are used in protein therapy. The present sequence is human heparanase DNA amplifying PCR primer used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  24-MAY-2002; 2002US-0382614P.

The may also be used in research, drug discovery, clinical medicine or forensic science. The present sequence is that of an oligonucleotide probe which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

New isolated keratinocyte derived interferon (KDI) polypeptide, useful for preventing, treating or ameliorating a medical condition, such as immune-related disorder, a viral infection, a viral exposure or cancer such as an or cancer.

Example 5; SEQ ID NO 50; 398pp; English

The invention relates to human keratinocyte derived interferon (KDI; ADF94966) and nucleic acids encoding it (ADF94965). The KDI gene is clocated on chromosome 9922: The invention also relates to sequences at the East 70% identical to the KDI nucleic acid and protein sequences; a copypeptide comprising an epitope-bearing portion of KDI; recombinant vectors and host cells comprising a KDI nucleic acid sequence; a method for the recombinant expression of KDI proteins; a KDI-specific antibody; KDI agonists and antagonists; use of KDI nucleic acids or proteins for treating medical conditions; a method for the diagnosis of a pathological condition or susceptibility to a pathological condition; and methods of screening for KDI binding partners. The KDI polypeptides and polynucleotides, and methods of the invention are useful for preventing, treating or ameliorating a medical condition, such as an immune-related disorder, cancer, or a viral infection or viral exposure. The present

A polypeptide of the invention has antinflammatory, dermatological, immunosuppressive, and antimicrobial activity, and may have a use in a vaccine. The polypeptide is useful for treating inflammatory diseases, such as inflammatory bowel disease, ulcerative colitis, Crohn's disease, atopic dermatitis, eczema, psoriasis, endotoxaemia, septicaemia, toxic shock syndrome or infectious diseases. The present sequence is used in
                                                                        Manufacturing target substance involves cultivating Corynebacterium thermoaminogenes strain modified to reduce accumulation of polysaccharide in liquid medium and collecting target substance accumulated in medium.

The present invention relates to novel jungle red fowl heparanase protein and polymucleotides encoding such proteins. Heparanase sequences can be used to develop treatments for various diseases, to develop diagnostic assays for these diseases and to provide new tools for basic and directed research especially in the fields of medicine and biology. They can be used to develop new drugs to inhibit tumour cell metastasis, inflammation and autoimmunity. Recombinant heparanase offers a potential treatment for wound healing, angiogenesis, restenosis, atheroselerosis, inflammation, wound healing, angiogenesis, restenosis, atheroselerosis, inflammation,

diseases (e.g. Genstmann disease and Alzheimer's

Genstmann-Straussler Syndrome,

The method of the invention is useful for manufacturing a target substance such as L-amino acid preferably L-glutamic acid. The method enables manufacture of L-glutamic acid at high temperatures and reduces the viscosity of culture medium. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                              Recombinant jungle red fowl (Gallus gallus) heparanase protein, useful for treating cancers, microbial infections and aiding wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        08-MAY-2003;

                                                                                                                                                           The present invention relates to a method (M) for detecting chromosome translocation. The method comprises amplifying a target nucleic acid sequence from a sample, hybridizing oligonucleotides (ONTs) specific regions of the translocation to the amplified target, where the ONTs comprise capture tags, extending the ONTs to produce labelled extended ONTs, hybridizing the ONTs to address tags on solid support and detecting the presence of labelled extended ONTs on the solid support and detecting the presence of labelled extended ONTs on the solid support and object useful for detecting a chromosomal translocation in a target nucleic acid sequence, preferably a cDNA from a biological sample from a human. The chromosome translocation is associated with cancer (e.g. leukaemia) and this method is especially useful for diagnosing cancer, especially

                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 22 BP; 10 A; 2 C; 9 G; 1 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the

                                                                                                                                                          The present invention relates to a method for determining a functional allele profile of a gene in a population. The method comprises identifying the nucleotide sequence of a gene of interest out of genomic DNA from each of a population of individuals identified as having a family history which indicates inheritance of functional alleles of the gene of interest, and rank ordering the frequency of occurrence of each haplotype, where the identity of the alleles containing each haplotype and the determination of their relative frequencies constitutes the functional allele profile of the gene of interest in the population. The method is useful for determining functional allele profiles which are useful in the treatment and diagnosis of diseases, for genetic and pharmacogenetic applications, and for meaning the degree to which the
                                                                                                                                                                                                                                                                                                                                                                                       Determining a functional allele profile of a gene in a population identifying the nucleotide sequence of a gene of genomic DNA from the individuals with a family history of functional alleles of the

Control of the relative to a substrate so that the tip and substrate to the substrate to generate a stable nucleic acid is transferred from the tip to the substrate which is hybridizable with complementary nucleic acid. The control is useful for generating nanoscale patterns of nucleic acid on a substrate, in which before transfer the tip is modified to allow the control of the control of the substrate upon transfer. The method is also useful for direct patterning of modified nucleic acid is also cuseful for direct patterning of modified nucleic acid is also useful for direct patterning of modified nucleic acid onto a substrate, by inking a scanning probe microscopic tip with a modified to chemisorb cuseful for the nucleic acid to the substrate to form a nanoscale acid and positioning the inked tip close enough to the substrate to effect transfer of the nucleic acid of to the substrate to form a nanoscale control of tip a first nucleic acid onto a substrate to effect with lateral nanoscale features of 1000 mm or less by direct write consumparticle, where the nanoparticle is functionalized with a second nucleic acid to the first. Deposition of mucleic acid deposit with the substrate to the first or complementary to make the substrate of expensive and the potentially destructiv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Depositing nucleic acid on substrate by direct-write nanolithography, positioning nanoscopic tip relative to substrate, to transfer nucleic acid to substrate and generate stable nucleic acid nanoscale pattern.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 38;

                        The specification describes a method of modifying the expression of at a toll-like receptor (TLR) in cells of the human central nervous system (CNS). The method comprises contacting the cells with a TLR-expression modifying agent, selected from substances that are endogenous to the human CNS and its parts or variants, that is capable of altering the expression of a TLR in the cells. The TLR-expression modifying agent is useful for preparing a pharmaceutical composition for retarding or inhibiting a neurodegenerative process and/or stimulating a neurodegenerative process and/or stimulating a neurodegenerative disease, multiple sclerosis or stroke. The present PCR primer was used to amplify cDNA encoding human TLR5. The primer was used to determine the amount of TLR present in human glia cells in a semi-quantitative RT-PCR
                                                                                                                                                                                                                                                                              e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Toll-like receptor; TLR; central nervous system; neurodegenerative disorder; Alzheimer's disease; pick's disease; multiple sclerosis; stroke; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ACC43827 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
The present invention relates to the isolation of DNA-binding protein 1 which acts as a collagen accumulation inhibitor. The invention also provides a method for collagen accumulation inhibition, and a method is earching for a substance which regulates the type-I collagen gene transcription regulating ability. The DNA binding protein YB-1 and the polynucleotide sequence encoding it are useful in compositions for inhibiting collagen accumulation, inhibiting transcription of a type-I collagen gene and inhibiting diseases caused by excessive accumulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               single chain transmembrane proteins. The hormones prolactin (PRL) and growth hormone (GH) exert their effects by inducing the homodimerisation of their respective receptors, initiating the activation of receptor-associated kinases and signalling cascades. The human PRLBP (hPRLBP) was identified in human serum and is homologous to the extracellular domain (ECD) of PRLR. A recombinant hPRLBP has been shown to inhibit PRL-induced cellular proliferation of Nb2 (not defined). The PRLBP, or composition containing it, is useful for inhibiting Nb2 cells, for diagnosing disease or conditions associated with somatolactogenic function, for raising an anti-PRLBP antibody, for treating breast and prostate cancer and for treating conditions associated with excess prolactin and growth hormone, such as pituitary adenomas, which can lead to hyperprolactinaemia or gigantism/acromegaly. The sequence presented is the PCR primer, PRLR-1, which was used to amplify the recombinant human PRLBP
                                                                                                                                                                                                                                                   Example
                                                                                                                                                                                                                                                                                                        specified

The present invention relates to the isolation of human keratinocyte derived interferon (KDI) protein, and the polynuclectide sequences encoding it. The gene encoding human KDI maps to chromosome 9. The novel KDI protein is a member of the interferon family. The invention also describes vectors, host cells, and recombinant methods for producing the KDI protein. The invention also discloses methods for identifying agonists and antagonists of KDI activity. An antibody that binds to the KDI protein, the KDI polypeptide sequence, and the polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human and mouse alpha-catenin polypeptides and their associated polynucleotides. The polypeptides and related antibodies are useful for modulating the cadherin-catenin related pathway in selected organs, such as the heart and testis. The nucleic acids and the antibodies are useful in the diagnosis and/or prediction of the likelihood of developing cadherin-catenin related diseases. The nucleic acids may also be used to predict the likelihood of developing cancer or in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic acids may also be used to predict the likelihood of developing cancer or in catenin related diseases, such as cancer, cardiomyopathy, specifically dilated cardiomyopathy, and male infertility. Sequences pecifically dilated cardiomyopathy, and male infertility. Sequences hark1510-ABK41599 represent PCR primers used to amplify DNA encoding human and mouse alpha-catenin polypeptides, including the CTNNA3 gene which encodes human alpha-catenin polypeptides, including the CTNNA3 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 22 BP; 2 A; 9 C; 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New alpha catenin polypeptides and polynucleotides encoding them, useful for predicting, diagnosing or treating cadherin-catenin related diseases, particularly cardiomyopathies, cancer and male infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Van
                                                                                                                                                                                                                     Heparanase; catalytic; cytostatic; antiviral; antibacterial; enzyme; anti-protozoan; neuroprotective; heparin; hpa; chicken; chimeric; human;

The encoded polypeptides can be used to prevent tumour angiogenesis, metastasis and invasion, and to intervene with pathologies associated with impaired heparin-binding growth factors, cellular responses to heparin-binding growth factors and cytokines, cell interaction with plasma lipoproteins, cellular susceptibility to viral, protozoa and bacterial infections or disintegration of neurodegenerative plaques. The present sequence represents a human heparanase (hpa) cDNA fragment amplifying PCR primer. This is used for generating a chimeric chicken-human heparanase gene

                                                                                                                                                                                                                  The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producin recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC

New alpha catenin polypeptides and polynucleotides encoding them, useful for predicting, diagnosing or treating cadherin-catenin related diseases particularly cardiomyopathies, cancer and male infertility. diseases,

Example; Page 35; 132pp; English.

The invention relates to human and mouse alpha-catenin polypeptides and their associated polynucleotides. The polypeptides and related antibodies are useful for modulating the cadherin-catenin related pathway in selected organs, such as the heart and testis. The nucleic acids and the antibodies are useful in the diagnosis and/or prediction of the likelihood of developing cadherin-catenin related diseases. The nucleic acids may also be used to predict the likelihood of developing cancer or in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic acid or the antibody is useful in manufacturing a medicament for treating cadherin-catenin related diseases, such as cancer, cardiomyopathy, so generated the second and male inferrility. Sequences ABK41510-ABK41599 represent PCR primers used to amplify DNA encoding human and mouse alpha-catenin polypeptides, including the CTNNA3 gene which encodes human alpha T-catenin

Polymucleotides comprising one or more of twenty four novel single nucleotide polymorphisms in the TNPRSF11B gene have been identified. TNPRSF11B regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abhormal osteoclast recruitment and function such as osteopprosis, metastatic bone disease, recruitment and function such as osteopprosis, metastatic bone disease,
                                          sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPS. The present invention includes kits for determining the presence or characteristics.
oligonucleotides of the SNP flanking sequence, the oligonucleotides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAH39817;
                                                                                                                                                                             New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nuc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single nucleotide polymorphism;

CC performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or cc identity of a SNP and for genotyping nucleic acid samples, for e.g. to cc assess by association analysis the genotype of an individual or group of cc individuals, having a pathological phenotypic trait suspected of being cc caused by one or more SNPs. Phenotypic traits suspected of being cc caused by one or more SNPs. Phenotypic traits suspected of being cc dystrophy, familial hypercholesterolaemia, polycystic kidney disease, cc dystrophy, familial hypercholesterolaemia, polycystic kidney disease, co steogenesis imperfecta and acute intermittent porphyria. Phenotypic craits also include symptoms of or usceptibility to multifactorial cdisease of which a component is or may be genetic such as autoimmune cc disease, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic ci microorganism. The method is also useful in forensic investigations and cc paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence

New nucleic acid derived from and drug screening, derived for the lipoprotein metabolism. from human chromosome genes romosome 9, implicated used e.g. for in disorders for diagnosis ers of

Claim 9; Page 226; 269pp; French

The present invention relates to coding sequences for human grandomosome 9q31-34 (ABN93375-ABN93455). The genes are likely involved in diseases of plasmatic lipoprotein metabolism, e.g reverse transport of cholesterol. The present sequence is a F involved in diseases of plasmatic reverse transport of cholesterol. used to illustrate the invention e.g. t genes ö primer

                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                       The invention relates to a novel mammalian protein, designated A-C1, and the polynucleotide encoding it. The protein inhibits the growth of cells transformed by H-ras, and so inhibits the development of cancer. The A-C: gene is expressed specifically in chondrogenic cells. The present sequence is a primer used in an example illustrating the invention

This invention relates to human polynucleotide sequence AAF7233 which encodes keratinocyte derived interferon (KDI) protein AAB49774, which is a member of the interferon family. AAF72338 represents the codon optimised sequence of KDI. The human KDI gene is located on chromosome The specification includes KDI related protein sequences AAB49775. AAB49789, Also given in the specification are primer, probe and polynucleotide sequences represented by AAF723370 (excluding AAF72339) which are used in the isolation and characterisation of the K sequence of the invention. The KDI polypeptide is used to treat viral infections and the protein and polynucleotide may be used to prevent, treat or ameliorate a medical condition such as immune system-related disorder, viral infection, viral exposure and cancer in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;

   CC Oligonuclectides AAZ45137-Z45140 specifically hybridise under stringent CC conditions to one of the matrix metalloproteinase-9 MMP-9 polymorphisms. CC MMP-9 is a zinc-dependent endopeptidase, and is located on chromosome 20. CC MMP activity is associated with inflammatory diseases and MMP-9 is crivity is associated with inflammatory diseases and MMP-9 is CC implicated in the pathology of multiple sclerosis. Certain polymorphic CC sequences in the MMP-9 promoter, coding sequence and 3' untranslated CC region of the human MMP-9 gene (see AAZ45145) can affect the severity of CC atherosclerosis. The invention relates to the presence or absence of one CC variant form of a MMP-9 gene polymorphism (-1562 Cytosine/Threonine). CC detection of this polymorphism can be used for disease prognosis. The CC gene. They are useful for the diagnosis and prognosis of diseases CC characterized by metalloproteinase mediated remodelling, such as CC atherosclerosis, tumour invasion and metastasis, inflammatory disease, CC and neurological diseases, particularly those involving demyelination CC such as multiple sclerosis, and arthritic disease. Proteins encoded by CC and metally to a molecule encoded by one variant of a polymorphic CC sequence, thus identifying compounds which modulate the activity of the CC enzyme. Such communida can then be used for rational disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                               Query Match
                                                                                                                                               The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA6613 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 22 BP; 6 A; 5 C; 5
                                                                                                                                                                                                                                                                                                                                                  New radiation hybrid map of the dog, Canine familiaris, for e.g. identifying genes implicated in phenotypic and or in genetic diseases and for studying dog pedigrees.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Galibert F,

                      The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9849/c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dihydro-2-(6-hydroxy-2-benzothiazolyl)-4-thiazole
                                                                                                                                                                                                                                                                                                                                           Claim 14; Page 251; 1592pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                              Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers {\bf r}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2000-679539/66.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   06-APR-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pulmonary hypertension; emphysema; pulmonary transplantation rejection;
